

One point per task, 33 tasks, 100 items each. The diagonal is where Jev matches the panel. The fitted slope does not differ from 1, so Jev's gap is a roughly constant offset rather than one that widens on harder tasks. On a logit scale the slope is 0.89 [0.77, 0.98], which would instead put Jev slightly further behind on the easiest tasks.
